Absolute Accuracy

Absolute Accuracy = Reading · Gain Error + Offset Error + Noise Uncertainty,

Noise Uncertainty = $3 \cdot \text{Random Noise} / \sqrt{(\# \text{ samples})}$

where Random Noise is the Input noise for the Sample Rate used,

3 converts the RMS value to peak value,

samples is the number of samples averaged

If the operating ambient temperature is outside the range of 23 °C ±5 °C,

include additional gain error of $\Delta T \cdot \text{Gain Stability}$ and additional offset error of $\Delta T \cdot \text{Offset Stability}$

where ΔT is the temperature difference between the ambient temperature and 18 °C or 28 °C, whichever is smaller.

¹ Accuracies listed are warranted for the conditions described in the tables and for up to one year from the module external calibration.

Temperature Stability

Gain stability 12 ppm/°C max

Offset stability 4.5 $\mu\text{V}/V_{\text{ex}}$ per °C max

Relative Gain and Offset Stability for Sample Rates >51.2 kS/s (PXIe-4331 only)

The following table represents relative gain and offset errors corresponding to the indicated temperature changes. Absolute Accuracy Example Calculations

Refer to the [Absolute Accuracy](#) section for the definition of absolute accuracy.

Example 1

For the 25 mV/V range with an excitation voltage of 10 V, an external temperature of 33 °C, a sample rate of 25.6 kS/s, with a sample of 100 readings, the absolute accuracy at full scale is as follows:

$$\text{deltaT} = 33\text{ °C} - 28\text{ °C} = 5\text{ °C}$$

$$\text{Gain Error} = 0.05\% + (0.0012\%/^{\circ}\text{C}) \cdot 5\text{ °C} = 0.056\%$$

$$\text{Offset Error} = 108\text{ }\mu\text{V}/10\text{ V} + (4.5\text{ }\mu\text{V}/10\text{ V}/^{\circ}\text{C}) \cdot 5\text{ °C} = 13.05\text{ }\mu\text{V}/\text{V}$$

$$\text{Noise Uncertainty} = 3 \cdot 0.18\text{ }\mu\text{V}/\text{V} / \sqrt{100} = 0.054\text{ }\mu\text{V}/\text{V}$$

$$\text{Absolute Accuracy} = 25\text{ mV}/\text{V} \cdot 0.056\% + 13.05\text{ }\mu\text{V}/\text{V} + 0.054\text{ }\mu\text{V}/\text{V} = 27.1\text{ }\mu\text{V}/\text{V}$$

Example 2

For the 25 mV/V range with an excitation voltage of 7.5 V, an external temperature of 33 °C, a sample rate of 60 kS/s, with a sample of 100 readings, the absolute accuracy at full scale is as follows:

$$\text{deltaT} = 33\text{ °C} - 28\text{ °C} = 5\text{ °C}$$

$$\text{Gain Error} = (0.05\% + 0.015\% \cdot 10\text{ V}/7.5\text{ V}) + (0.0012\%/^{\circ}\text{C}) \cdot 5\text{ °C} = 0.076\%$$

$$\text{Offset Error} = 138\text{ }\mu\text{V}/7.5\text{ V} + (4.5\text{ }\mu\text{V}/7.5\text{ V}/^{\circ}\text{C}) \cdot 5\text{ °C} = 21.4\text{ }\mu\text{V}/\text{V}$$

$$\text{Noise Uncertainty} = 3 \cdot 0.5\text{ }\mu\text{V}/\text{V} \cdot \sqrt{60\text{ kS}/\text{s} / 102.4\text{ kS}/\text{s}} / \sqrt{100} = 0.115\text{ }\mu\text{V}/\text{V}$$

$$\text{Absolute Accuracy} = 25\text{ mV}/\text{V} \cdot 0.076\% + 21.4\text{ }\mu\text{V}/\text{V} + 0.115\text{ }\mu\text{V}/\text{V} = 40.5\text{ }\mu\text{V}/\text{V}$$

Example 3

This example includes the accuracy calculation within $\pm 5\text{ °C}$ of a bridge-null operation.

For the 25 mV/V range with an excitation voltage of 10 V, an external temperature of 32 °C, a sample rate of 25.6 kS/s, with a sample of 100 readings, and measurements within $\pm 5\text{ °C}$ of a bridge-null operation, the absolute accuracy at 2 mV/V is as follows:

$$\text{deltaT} = 32\text{ °C} - 28\text{ °C} = 4\text{ °C}$$

$$\text{deltaT}_{\text{from_bridge_null}} = 5\text{ °C}$$

$$\text{Gain Error} = 0.05\% + (0.0012\%/^{\circ}\text{C}) \cdot 4\text{ °C} = 0.055\%$$

$$\text{Offset Error} = (4.5\text{ }\mu\text{V}/10\text{ V}/^{\circ}\text{C}) \cdot 5\text{ °C} = 2.25\text{ }\mu\text{V}/\text{V}$$

$$\text{Noise Uncertainty} = 3 \cdot 0.18\text{ }\mu\text{V}/\text{V} / \sqrt{100} = 0.054\text{ }\mu\text{V}/\text{V}$$

$$\text{Absolute Accuracy} = 2\text{ mV}/\text{V} \cdot 0.055\% + 2.25\text{ }\mu\text{V}/\text{V} + 0.054\text{ }\mu\text{V}/\text{V} = 3.4\text{ }\mu\text{V}/\text{V}$$

Example 4

This example includes the accuracy calculation within $\pm 6\text{ °C}$ of a bridge-null operation for sample rates above 51.2 kS/s.

For the 25 mV/V range with an excitation voltage of 7.5 V, an external temperature of 32 °C, a sample rate of 60 kS/s, with a sample of 100 readings, and measurements within $\pm 6\text{ °C}$ of a bridge-null operation, the absolute accuracy at 2 mV/V is as follows:

$$\text{deltaT} = 32\text{ °C} - 28\text{ °C} = 4\text{ °C}$$

$$\text{deltaT}_{\text{from_bridge_null}} = 6\text{ °C}$$

$$\text{Gain Error} = (0.05\% + 0.015\% \cdot 10\text{ V}/7.5\text{ V}) + (0.0012\%/^{\circ}\text{C}) \cdot 4\text{ °C} = 0.0748\%$$

$$\text{Offset Error} = (4.5\text{ }\mu\text{V}/7.5\text{ V}/^{\circ}\text{C}) \cdot 6\text{ °C} + 30\text{ }\mu\text{V}/7.5\text{ V} = 7.6\text{ }\mu\text{V}/\text{V}$$

$$\text{Noise Uncertainty} = 3 \cdot 0.5\text{ }\mu\text{V}/\text{V} \cdot \sqrt{60\text{ kS}/\text{s} / 102.4\text{ kS}/\text{s}} / \sqrt{100} = 0.115\text{ }\mu\text{V}/\text{V}$$

$$\text{Absolute Accuracy} = 2\text{ mV}/\text{V} \cdot 0.0748\% + 7.6\text{ }\mu\text{V}/\text{V} + 0.115\text{ }\mu\text{V}/\text{V} = 9.2\text{ }\mu\text{V}/\text{V}$$
